

Voltage-Mode PWM Controller IC

The KIA494AP/AF incorporates on a single monolithic chip all the functions required in the construction of a pulse-width-modulation control circuit. Designed primarily for power supply control, this device offers the systems engineer the flexibility to tailor the power supply control circuitry to a specific application.

The KIA494AP/AF contains two error amplifiers, an on-chip adjustable oscillator, a dead-time control(DTC) comparator, a pulse-steering control flip-flop, a 5-V, 5%-precision regulator, and output-control circuits.

The error amplifiers exhibit a common-mode voltage range from $-0.3V$ to $V_{CC} - 2V$. The dead-time control comparator has a fixed offset that provides approximately 5% dead time. The on-chip oscillator may be bypassed by terminating RT to the reference output and providing a sawtooth input to CT, or it may drive the common circuits in synchronous multiple-rail power supplies.

The uncommitted output transistors provide either common-emitter or emitter-follower output capability. The KIA494AP/AF provides for push-pull or single-ended output operation, which may be selected through the output-control function.

The architecture of this device prohibits the possibility of either output being pulsed twice during push-pull operation.

FEATURES

- Completed PWM Power Control Circuitry.
- Uncommitted Outputs for 200mA Sink or Source Current.
- Output Control Selects Single-Ended or Push-Pull Operation.
- Internal Circuitry Prohibits Double Pulse at Either Output.
- Variable Dead Time Provides Control Over Total Range.
- Internal Regulator Provides a Stable 5V Reference Supply With 5% Tolerance.
- Circuit Architecture Allows Easy Synchronization.
